

Audio Rendering/Processing and Control Ubiquity

a solution built using the Faust dynamic compiler
and JACK/NetJack

Stéphane Letz, Sarah Denoux, Yann Orlarey

journée FEEVER, 13 octobre 2014

The "control, compute, communicate" model

Separation of concern

- A typical audio processing application can be separated in three parts: *control*, *compute*, *communicate* (with the audio card)

- The three different parts can be deployed on different machines or control devices

Using Faust for DSP processing, JACK/NetJack for audio

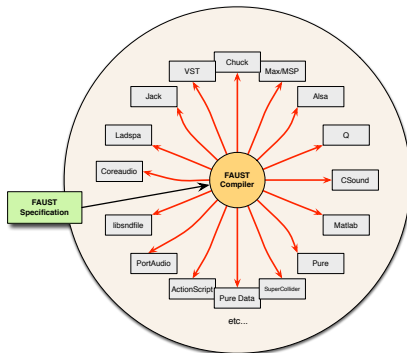

How to develop/deploy audio applications following this scheme:

- using easily reusable and combinable libraries, to be deployed on machines, tablets, smartphones...
- distributed as open-source components : Faust as a Domain Specific Language for DSP processing ("compute"), JACK/NetJack for audio processing/rendering ("communicate")

Faust Language

- Faust as a *Domain-Specific Language* for real-time signal processing and synthesis. A Faust program denotes a *signal processor*.
- Faust as a *high-level description language* and a *compiler*
- Faust as a flexible *multiple targets* DSP application/plugin deployment ecosystem

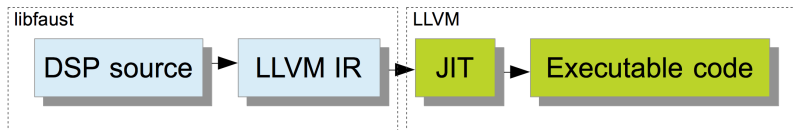

Faust architecture file system

Separation of concern

The *architecture file* describes how to connect the audio computation to the external world.

Embedding the dynamic compilation chain : *libfaust* + LLVM

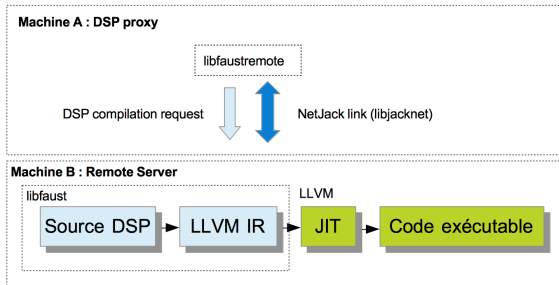

- the Faust compiler is now available as an embeddable library called *libfaust*
- a LLVM IR backend is added in Faust compiler
- linked with LLVM JIT libraries to produce native executable code in memory
- `createDSPFactory(...)`, `createDSPInstance(...)`

JACK/NetJack system used to establish remote communication and computation setup:

- NetJack is low-latency master/slave audio/MIDI communication protocol integrated in JACK2 as a set of standalone components (*netmanager*, *net backend*, *netadapter*)
- NetJack can also be used as a embeddable library called *libjacknet* (without having to run under the JACK server)
- *master* part of the protocol is triggered by the audio card
- *slave* part of the protocol will be synchronized (buffer size, sample rate...) with the master through the network link

DSP proxy via remote DSP computation

- Remote Server : waiting for compilation requests (Faust DSP source)
- server side : uses *libfaust* + LLVM for dynamic compilation
- server/client : audio + control link with *libjacknet*
- client side : *libfaustremote* proxy library with `createRemoteDSPFactory(...)`, `createRemoteDSPInstance(...)`

DEMO using *FaustLive* application

FaustLive (developed at GRAME by Sarah Denoux) aims to create a dynamic environment for Faust prototyping

The screenshot displays the FaustLive application interface. On the left, a signal flow graph shows a 'hard' input connected to a series of 'position()' and 'string@hds...' modules. The central panel features several audio processing modules with adjustable parameters:

- FLW-1: cubic_distortion**: Includes 'Window Options' and a 'cubic_distortion' parameter.
- SINE WAVE OSCILLATOR oscars**: Includes 'Amplitude', 'Frequency', and 'Portamento' sliders.
- CUBIC NONLINEARITY cubnonl**: Includes a 'Bypass' checkbox, 'Drive', and 'Offset' sliders.
- CONSTANT-Q SPECTRUM ANALYZER (SQ)**: Includes a bar graph and 'SPECTRUM ANALYZER CONTROLS' with 'Level Averaging Time' and 'Level dB Offset' sliders.

On the right side, there are additional control panels for 'harpautomation' (with 'log3d', 'mapler', and 'limbre' sliders) and 'FLW-3: oscsynth' (with 'osc-synth' and 'ANAL' sliders). A QR code and connection information are visible at the bottom right.

Remote control using OSC, HTTP, WebSocket...

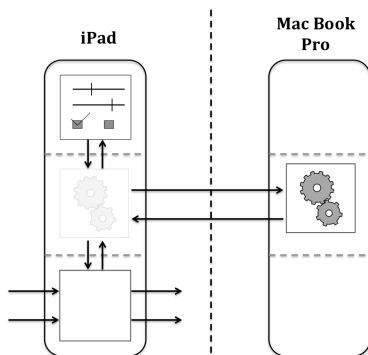

- the running application starts an embedded HTTP server (developed using *libmicrohttpd* library)
- the remote control code runs is delivered as an HTML page
- to be executed on a remote device

Remote communication using JACK/NetJack

- starting the JACK server on another machine, loaded with the *netmanager* master component
- in FaustLive, switching the audio driver to NetJack (*slave* mode)

Remote computation using libfaustremote

- quickly experiment Faust applications that use accelerometers
- on iOS where embedded dynamic compilers are not allowed...

Application final export using the FaustWeb compilation service

FaustWeb offers a multiple targets compilation service :

- list of available targets is returned by the server
- then the DSP code is sent and compiled on the server, and delivered back as a binary
- directly usable on the iPad as an autonomous application

Software components for the Control, Compute, Communicate model

Part of the Faust project :

- *libfaust* : library version of the Faust compiler
- *libfaustremote* : proxy access to remote computation server code
- Look at <http://sourceforge.net/projects/faudiostream/> on the faust2 branch

Part of the JACK2 project :

- *libjacknet* : library version of the master/slave NetJack protocol
- Look at <https://github.com/jackaudio/jack2>
